

WHIPLASH

Submitted By: Dr. Susmita Paul, DC
Family Chiropractic of Leesburg

After an automobile accident you may feel pain in the neck back and other parts of the body. Your neck is jam packed with nerves, glands, tubes, blood and lymph vessels, and 48 different joints plus your brain stem, spinal cord, spinal column, muscles, ligaments, tendons, fluids, meninges and more! If the head and neck are thrown or snapped back and forth very quickly, you can have a whiplash injury. Whiplash is seen in Auto accidents, falls and in collisions such as football, boxing, taekwondo and other sports. In addition to the disc and spinal column misalignment and irrational and stretching and impingement to the nerves and spinal cord. Millions of people suffer whiplash damage each year. Whiplash can cause headache, numbness, coldness or pins and needles in the face, chest, arms, wrists or hands. They can also result in pain, ear ringing, dizziness, hearing loss, eye pain, blurred vision, sensitivity to light and other symptoms. One of the therapies that can give you relief is chiropractic care. Chiropractic has been a blessing to millions of people suffering from neck and whiplash problems, saving many suffers from unnecessary drugs and surgery. At the moment you receive a chiropractic adjustment hundreds and thousands of body functions are affected and your nerves are better able to send life's messages to your brain and other internal organs begin to function more efficiently. Chiropractic is needed in fact even when medical procedures may also be necessary. If an injury is serious enough to need medical care, the spine and body alignment is almost always damaged. Further, medical doctors are simply not trained to locate and correct spinal subluxations . At times X-Ray, CT, CAT Scan, MRI's, Thermography Scans are needed to help determine the extent of the injuries. All of the above scans are test of the 'anatomy' with the exception of Thermography it is unique in its capability to show physiological change and metabolic processes. It has also proven to be a very useful complementary procedure to other diagnostic modalities. Thermography is one of the only imaging procedures to show whiplash and treatment progress which might be helpful in a court case or for insurance to have a medical documented dated report of all your soft tissue injures that may be shown at a later date. More importantly you will see all the trigger points so that you may get more accurate treatment so that you can possible feel better faster.
